2008: A Year of Growth

webScurity install base more than doubled

Minneapolis, MN – January 15, 2009 – webScurity, developer of leading edge Web Application Firewall (WAF) security technology webApp.**secure**[™], pronounced 2008 a milestone year. The firm gained new clients in key market segments, released a new version of its solution and more than doubled its installed base.

The Company's proven WAF technology now resides in public and private sector organizations in the U.S. and internationally. During the year, webScurity grew its reseller channels among website hosting firms, PCI assessors, web development firms and unified threat management (UTM) security appliance manufacturers. This was in addition to its direct-sale portfolio of end-users.

Wayne Ziebarth, webScurity President said, "2008 was a great year. It was rewarding to gain the trust of many new customers. We're gratified to hear them express their confidence and peace of mind for the level of protection webApp.**secure** provides their sites. Our new version 4.2 extends the competitive edge our clients count on for security."

Ziebarth continued, "A major market driver was a new PCI-compliance requirement that includes WAF integration. Our clients have no worries about out-of-compliance penalties, such as large fines or revocation of the ability to process credit cards. Another growth contributor was the ability of cyber-criminals to compromise the confidentiality, integrity and accessibility of web sites. Simply stated, the black hats are getting better at getting worse. Our solution keeps hackers out."

A third growth factor: the product. With its unique design among WAF solutions, webApp.**secure** installs and configures in minutes. Written in 'C', it has a small footprint (fits on a floppy disk), negligible latency (averages one millisecond per transaction) and runs on any operating system, with any web browser and any development platform. Independent third-party evaluators and scanners rate its effectiveness at blocking application-layer exploits higher than 99.9%.

webScurity was founded seven years ago as a privately-held, Web application firewall publisher based in the Twin Cities. Its client list includes financial institutions, higher education, State of Minnesota, private and public sector organizations, hosting firms, Web developers and UTM manufacturers. webApp.**secure** has been protecting websites and applications since 2002.
