webScurity Launches the First Affordable and Downloadable Web Application Firewall

webScurity Inc. Releases webApp.secure[TM] *SE*

Minneapolis, Minn. - September 24, 2002 - webScurity Inc. announced today the introduction of its webApp.secure[TM] SE, the first in its line of .secure[TM] security software.

webApp.secure SE is the first downloadable application firewall that protects Web sites against application-level attacks. The software proactively prevents breeches by enforcing a site's Intended Use Guidelines[TM] (IUG). Instead of identifying malicious activities based on known attack signatures, webApp.secure SE uses advanced web/insite[TM] technology to build a set of allowable actions from the site's own Web pages, giving it the ability to protect against both known and unknown attacks.

While system administrators deploy sophisticated network-level security technologies, attackers enter through the same open "door" that allows legitimate users to access the Web server. "From that point, it's simply a matter of determining what vulnerabilities in the Web server or applications they can exploit. webApp.secure SE makes sure all requests follow the rules as defined by the Web site," says webScurity president, Wayne Ziebarth. "All traffic that doesn't follow the rules is automatically rejected."

By simply enforcing the IUG inherent in any Web site, 100% immunity to past, present, and future Port 80/443 threats is absolutely guaranteed. This is in stark contrast to other products that rely on signature-recognition and, by definition, can only protect against known attacks.

webApp.secure SE protects a Web site against:

- Defacement
- Known and unknown server worms like Code Red and Nimda
- Many other common application attacks

In response to the increasing demand for accessible and affordable Web application security defenses, the software is available for download at www.webscurity.com, at an introductory price of $495.

About webScurity Inc.
webScurity Inc. specializes in taking the risk out of doing business on the Web. The company focuses exclusively on the most vulnerable element of e-business - the applications. webScurity focuses on a largely overlooked segment of Web security - how Web applications are written and deployed. Through its vulnerability assessment and secure development services, webScurity helps organizations ensure their Web applications are not the weakest link in the security chain.

Editors Note: take if for a test drive - webScurity is also offering a FREE 30-day trial of webApp.secure SE.
